

Digital Edify Agentic CRM

Gaps & 12-Week Shipping Plan

Cadence: one major capability shipped to production every week. Each release is something a customer-facing team can see, use, and judge.

Part 1 — The Gaps

What is missing today, measured against the target architecture in the product documents.
Grouped so the business audience can see the shape of the work.

A. Customer-Facing Capability Gaps

#	Gap	What it means
1	Daily ranked call list	Advisors don't have a single morning surface; lead intelligence is spread across screens.
2	Outbound WhatsApp send	Agents draft, but messages aren't actually leaving the system end-to-end.
3	Outbound email send	No SMTP/email path is wired; outreach is WhatsApp-only on paper, neither in practice.
4	Auto-send for pre-approved nudges	Every message — even the 5-minute welcome — currently waits for a human.
5	Duplicate lead prevention	No probabilistic identity resolver; the same prospect can land twice and waste advisor time.
6	Support agent	No auto-triage, root-cause tagging, or KB deflection; tickets are still human-routed.
7	Finance agent	Revenue isn't real numbers in the dashboard; balance, payment status, and history-aware reminders don't exist.
8	Operations agent	No trainer load balancing, no schedule-collision detection, no Zoom/room allocation.
9	Career agent	Placement funnel isn't tracked; mock interviews and certificates are manual.
10	Cross-domain supervisor (Edify Assistant)	Current assistant answers from a snapshot but cannot dispatch actions across domain agents.

B. Trust & Safety Gaps

#	Gap	What it means
11	Enterprise auth (Auth0)	Running on a custom bcrypt + role-based system; not enterprise-ready.
12	Fine-grained authorization (FGA)	No relationship-based, on-behalf-of permissions; agents can't be given time-boxed grants.
13	Sensitive-action approvals	Refunds, fee waivers, credential changes, certificates, employer-share don't have explicit human-only gates.
14	Token Vault for secrets	Channel and integration credentials live in environment variables, not a vault.
15	Shared Zoom password	Flagged as a P0 issue in the PRD; still unresolved.
16	Prompt-injection defenses	Inbound message content is treated like trusted data; no test suite proves it isn't.

C. Quality & Observability Gaps

#	Gap	What it means
17	Automated evals (golden datasets, CI gate)	No quality bar enforced before a release; agents can silently regress.
18	Tracing / observability (OTel-GenAI)	No end-to-end span view of an agent run; debugging is by eyeballing logs.
19	Grounding metric	No enforced "zero ungrounded fees, dates, or promises" check.
20	Production traces feeding back into eval set	No learning loop from real runs.

D. Memory & Knowledge Gaps

#	Gap	What it means
21	Episodic memory	No per-learner rolling summary; every conversation starts from scratch.
22	Semantic memory / KB grounding	Embeddings table exists but isn't used to answer questions or deflect tickets.
23	Provenance + decay + right-to-be-forgotten	Facts have no source, no expiry, no deletion cascade.

E. Platform & Multi-Tenant Gaps

#	Gap	What it means
24	Core/config split	Tenant specifics are baked into code; a second customer would need code changes.
25	Control plane	No tenant registry, no provisioning script, no fleet visibility.
26	Per-tenant database isolation	Currently shared DB with row-level security; doc-spec target is separate Postgres per tenant.
27	Customer #2 onboarding via config	The actual product-market gate isn't reachable today.
28	Canonical event log	<code>audit_log</code> exists but isn't the spine every consequential action writes through.
29	Ontology / Choice Lists	Status and rating values are hard-coded strings, not a configurable ontology table.
30	MCP tool gateway	No chokepoint where every tool call is authorized, telemetered, and credential-injected.
31	Identity resolver review queue	No human-in-loop UI for ambiguous matches.

Part 2 — The Planned Order

Each week closes a defined set of gaps. The visible ship is what stakeholders will see in production that week; the hidden work is what we fold in alongside it.

Wk	Visible Ship	Gaps Closed
1	Daily Call List + tracing	#1, #18
2	One-Tap WhatsApp Send + auto-nudges	#2, #4
3	Email Send + Duplicate Lead Prevention	#3, #5, #31, #29 (start)
4	Quality Guarantee (Eval Harness)	#17, #19, #20, #16
5	Enterprise Auth (Auth0 + FGA)	#11, #12, #13, #14, #15
6	Support Agent (live)	#6, #28
7	Finance Agent (revenue becomes real)	#7, #13 (refunds/waivers)
8	Memory + Knowledge-Grounded Answers	#21, #22, #23
9	Operations Agent	#8
10	Career Agent	#9
11	Edify Assistant (Cross-Domain Supervisor)	#10, #30
12	Customer #2 from Configuration	#24, #25, #26, #27

How to Read This Order

- **Weeks 1–3 — Visible Value.** Close the gaps the customer feels every day: ranked work, real send, no duplicates.
- **Weeks 4–5 — Trust.** Without quality and authorization in place we cannot responsibly turn on agents that touch money or credentials.
- **Weeks 6–10 — Domain Agents.** One new agent per week, each landing on a foundation that's already safe and observable.
- **Weeks 11–12 — Platform Proof.** A single assistant across the whole business, then a second institute live on configuration alone.

Slip rule. If a week is at risk, internal/platform work moves; the visible ship does not.

Closing Statement

Every week, in production. Every release, visible to a customer. Every twelve weeks, a second institute could go live without us writing new code.

That's the bar.
